

IDM INFORMATION DEVELOPMENT MYANMAR

▲ ID Myanmar takes pride in their practical classes. They have introduced immediately ready workforces to many companies in server and network infrastructure industries.

▲ They hold classes in which students can have hands-on experience at server and network devices. For this they use Cisco network products.

▲ Managing Director, Ms. Hayashi, who moved to Myanmar in 2001, not only speaks English fluently, but also masters Burmese in which she communicates with the other staff.

Popular hands-on classes raising immediately ready IT personnel

Information Development Co., Ltd. was established in 1969 and is experienced in software development and system operation management within Japan. In 2015 they expanded their business to Myanmar. They have established "IDM INFORMATION DEVELOPMENT MYANMAR/ID Myanmar" in this area because of expected strong demand in IT infrastructure due to economic development. They offer training and introducing their graduates as IT personnel, while also doing overseas software development.

The company helps 80% of the graduates get hired at their ideal company and contributes to the career enhancement of career changers. The curriculum heavily focuses on network and server infrastructure and utilizes its greatest strength: hands-on classes. Typically, even in IT universities, students have rare access to these machines, which makes classroom-style classes more common. However, ID Myanmar has instructors with experience from both universities and private companies who can carefully educate while utilizing these machines. This is why great things can be expected from these graduates in the future.

The goal of the classes is fostering the students' minds to seek out the answers themselves. For people from Myanmar to work in Japanese companies, they will have to change from passive to answer-seeking attitude. ID Myanmar is making sure that their students have complete understanding of business etiquette and know how to properly create business documents while also improving their presentation skills. Managing Director Ms. Hayashi says, "Companies prefer employees who can hit the ground running, and that is why ID Myanmar is popular." It is inevitable

that demand for IT will increase in this area and make network and server infrastructure common. This will cause a demand in security reinforcement. She says, "I think that our whole society doesn't fully understand the threat of viruses and information leaks, but when society does reach that point, our staff and curriculum will likely be appreciated."

Furthermore, within many employment agencies, candidates are being mismatched with employers because the person in charge doesn't completely understand IT, which results in employees leave the company within few months. However, within ID Myanmar, the instructors directly interact with the IT professionals of the desirable company to prevent any mismatches.

She says, "The students work in close contact with the instructors, which is one of the characteristics of ID Myanmar. They spend more than 200 hours together, so the instructors have a clear image of the students' personality which makes it very easy to match them."

We very much recommend people who are looking for IT personnel to contact ID Myanmar.

▲ The staff consists of 6 people: 3 instructors, 2 admins and Managing Director Ms. Hayashi. ID Myanmar is also increasing the number of software development staff.
